Teaching Experience

Representative Lecturing at WUSTL:

Chemistry 261: Organic Chemistry I with Lab (Fall 2020): 276 students

- The first part of a two-semester survey of organic chemistry lecture and lab. The course includes an introduction to organic structures, reactions, and reaction mechanisms. The laboratory is an introduction to methods in organic chemistry including separation and methods of purification of organic compounds.

Chemistry 452: Synthetic Polymer Chemistry (Spring 2022): 15 students

- CHE 452 is an upper-level undergraduate and graduate level course that describes various methods for the synthesis and characterization of polymers. Copolymers, control of architecture, sequence, polymer reactivity, polymer properties, structure/property relationships, and applications of polymers are discussed. Current topics of interest from the recent literature are also covered. The learning objective should be that students are familiar with a variety of polymerization techniques – both in terms of mechanism and protocol – and they are able to design specific monomers in order to develop novel polymeric materials with precise architectures, molecular weights, and function.

Chemistry 462: Advanced Polymer Chemistry Laboratory (Spring 2022): 5 students

- In spring 2020, I created a new advanced polymer laboratory with Dr. Rong Chen (Senior Lecturer) to go along with the lecture course, which raised it to a four-credit hour course. After a faculty approved vote, the course was converted to a standalone advanced laboratory with a writing intensive component, beginning in spring 2021. In the lab, students do four standard experiments on step-growth, ring-opening, anionic, and atom transfer radical polymerizations to gain basic skills in making and characterizing polymers. These standard labs are then followed by independent projects in which we collaborate with the students as they pursue projects that they create, which build on already published works. Enrolled students also give an oral presentation at the end of the semester, where they describe their independent proposal and research progress. In taking this lab, students gain first-hand knowledge of polymer synthesis and characterization (NMR and GPC), as well as several other techniques like dynamic light scattering, rheology, etc
